

# Larvae for Layers

*The science behind switching from fishmeal to Black Soldier Fly Larvae (BSFL) meal.*

## Reasons to Love Larvae

Can be raised on waste products!

Protein levels can be tweaked. When raised on substrates such as brewery by-products, larvae can boost the protein in your bird's diet.

Limited space is needed to raise them!

## Impact on Layers & Sustainability

No adverse effects on layer growth or performance.

In this study, rearing the larvae on leftovers increased their sustainability as a protein source.

Produced eggs with increased weight and bigger yolks.

## Should you leap on larvae?

These larvae serve as an intensive protein and fat source in poultry feed that can be raised sustainably.

The European Union and Australia have already approved BSFL for use as a substitute for fishmeal in poultry diets.
